Monitoring Airport: Routing to Destination (Picture: [1])

H. Perrey

Secure Routing in SAFES1

Routing Protocol For Low-Power and Lossy Networks (RPL): Topology Initialization (RFC [3])

Creating Routes to the Root

- RPL topology is based on a Destination Oriented Directed Acyclic Graph (DODAG)
- Root begins to send Information Objects (DIO) in ICMPv6 messages
- Nodes may request a DIO using solicitation messages (DIS)

4 **A** N A **B** N A **B** N

Routing Protocol For Low-Power and Lossy Networks (RPL): Topology Initialization (RFC [3])

Creating Routes to the Root

- Nodes may join the DODAG using information in DIO
- Nodes choose a set of parents for forwarding packets
- Each note has a rank (relative position in graph to root)
- Nodes distribute DIO messages

- A TE N A TE N

Routing Protocol For Low-Power and Lossy Networks (RPL): Topology Initialization (RFC [3])

Topology:

- DIO messages build Upward-routes (towards the root)
- Destination Advertisements (DAO) build downward routes
- Initially topology is created (proactive), inconsistencies (e.g. loops) are detected reactively

Traffic Flow

Multipoint-to-point (MP2P), P2MP, and P2P traffic supported

RPL: Multipoint-to-Point Traffic Flow

9/18

RPL: Point-to-Multipoint Traffic Flow

RPL: Point-to-Point Traffic Flow

State of Play

Why use RPL?

- Low rate of control messages: Bootstrapping topology, reactively repairing inconsistencies
- Using IPv6: connectivity to other part of the internet (Internet of Things)
- New academic approach for promising research

Final Decision pending

Use of RPL in SAFEST still under discussion! (Comparison e.g. OLSR)

Content

2 Security Outline on Routing in SAFEST Network

- RPL Security Concepts
- Exemplary Lightweight Approach

E 5 4 E

RPL Security Concepts

Optional Security Modes

- Unsecure: no additional security (e.g. using link layer security)
- Preinstalled: one (preinstalled) key for Integrity, Confidentiality, Authenticity
- **Authenticated**: one (preinstalled) key to join and a second key for Integrity, Confidentiality, Authenticity

4 3 5 4 3 5

RPL Security Concepts

Security Issues within RPL

- **RPL requires preinstalled keys**, and does not state key management approach.
- No lightweight security paradigm in RPL: focus on low-power routing, but not low-power security
- No asymmetric cryptography for authenticated mode defined in RPL (only suitable for stronger nodes!)

Proposal and Challenges for SAFEST

- Lightweight security for weak nodes and basic security for stronger nodes (e.g. asymmetric cryptography)
- Trust establishment between root/nodes
- Feasible attacks and attacker model
